

Neverfail Low Bandwidth Module

provides exceptional reduction of data transmission in a LAN or WAN environment **for all Neverfail software products**

Today, no business can afford downtime. The Neverfail Group's easy-to-use and highly affordable software solutions enable companies of all sizes to keep their users and applications connected at all times, regardless of the cause of failure - maximizing productivity and profitability.

The heart and soul of the Neverfail products – Neverfail Heartbeat

The most important consideration in protecting your environment is creating a real-time, duplicate copy of your data. Neverfail Heartbeat sits at the core of Neverfail's suite of affordable, "cluster-class" solutions, replicating data from your active to your passive server, whether they reside in the same server room, or across the globe.

Bandwidth Optimization

For some organizations, the cost of bandwidth may appear prohibitive, or they may simply require more efficient use of their existing bandwidth. The Neverfail Low Bandwidth Module (LBM) can reduce the bandwidth usage between the two servers more effectively, so that networking costs are reduced. Neverfail LBM can be implemented in both a LAN and WAN environment.

The Benefits of the LBM

- LBM reduces the requirement for costly increased bandwidth with overall lower total cost of ownership
- Significantly reduces the data transmission times by up to 66%
- Substantial enhancement of data protection
- Faster switchover times; maximum performance and data throughput
- Eliminates costly external 3rd-party products
- Improves application response time on congested WAN links
- Less impact on your production network
